

Project Design Phase

Proposed Solution

Date	30 June 2026
Roll Number	23A51A42A3
Project Name	Leave Approval System
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Organizations face inefficiencies in managing employee leave requests. Manual or email-based processes cause delays, data errors, and poor communication between employees, managers, and HR departments. Employees lack visibility into their leave status, and managers spend unnecessary time tracking approvals.
2.	Idea / Solution Description	The proposed solution is a ServiceNow-based Leave Approval System that automates the entire leave management workflow. Employees submit leave requests through a custom form specifying leave type, start date, and end date. The system validates dates, uses Flow Designer for manager approval, and sends instant notifications to employees. All leave records are stored securely in the ServiceNow database for tracking and reporting.
3.	Novelty / Uniqueness	The solution leverages ServiceNow's low-code platform to create a fully automated workflow without external dependencies. Its uniqueness lies in real-time validation, automated routing, and instant notifications, ensuring zero manual intervention and seamless integration with existing organizational modules.
4.	Social Impact / Customer Satisfaction	The system enhances transparency and trust between employees and management. Employees experience faster approvals and clear communication, while managers benefit from reduced administrative workload. Overall, it improves workplace satisfaction, productivity, and organizational efficiency.
5.	Business Model (Revenue Model)	The solution can be offered as a subscription-based ServiceNow module for organizations. Revenue can be generated through licensing, customization services, and maintenance support. It can also be integrated into enterprise HR systems as a premium workflow enhancement.
6.	Scalability of the Solution	Built on the ServiceNow cloud platform, the system is highly scalable. It can handle increasing numbers of employees, departments, and approval hierarchies without performance degradation. Additional features like analytics dashboards and mobile access can be added easily as the organization grows.
